SOLANA MOBILE BUILDER GRANT · APPLICATION DECK

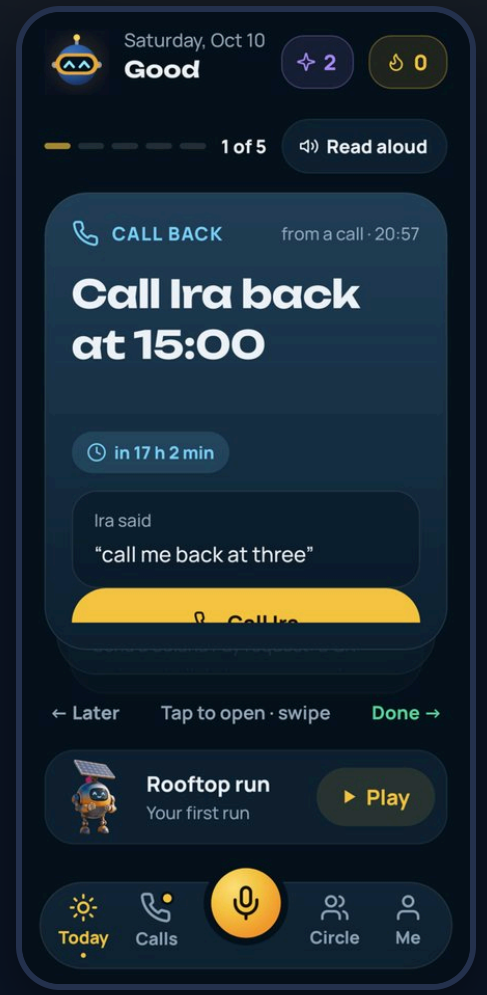

Sol: the AI secretary for Seeker

Sol answers the calls you miss, turns each one into an action card, and settles money on Solana with one approval in your own wallet: Seed Vault on Seeker, or Phantom and Solflare over Mobile Wallet Adapter.

Native Kotlin Android · MWA 2.0 · Solana mainnet · MIT open source

Vadym Bilobrovets · solo founder · Solar DePin · Ukraine

github.com/Solar-DePIN-Hub/solarchik-assistant · demo youtu.be/L5×6iLObUxs

THE PROBLEM

A missed call is a lost client. A scam call is lost money.

Calls get missed

Freelancers and small business owners miss calls in meetings, while driving, while working. Nobody listens to voicemail, so the client just calls someone else.

Calls ask for money

"Send me back for lunch", "pay the deposit", "urgent, send to this address". Real requests and scams sound the same, and the call lives in one app while the wallet lives in another.

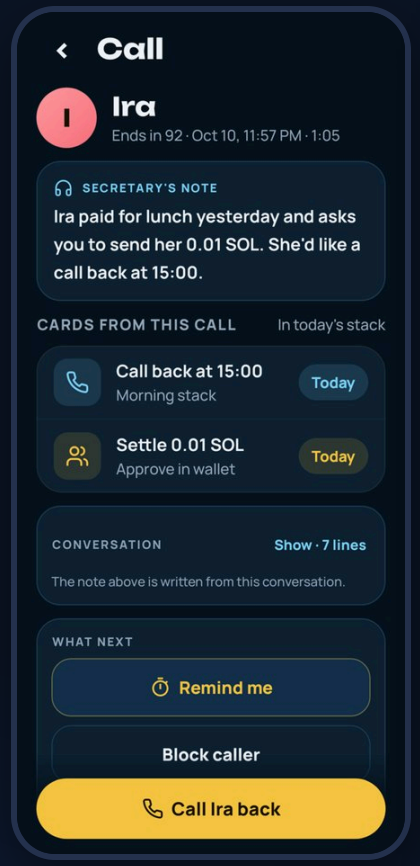

Wallets have no daily reason

On most phones the crypto wallet is a dashboard you open once a week. Seeker puts a hardware-backed wallet in every pocket, but few apps give people a reason to use it every day.

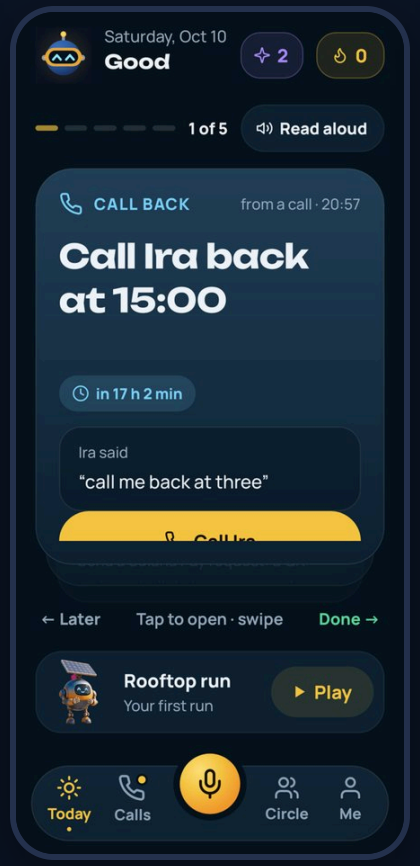

People already pay for call screening: Truecaller Premium ($9.99/month in the US App Store) and AI receptionists like Rosie (from $49/month). None of them turns a call into a wallet action.

THE PRODUCT · LIVE TODAY

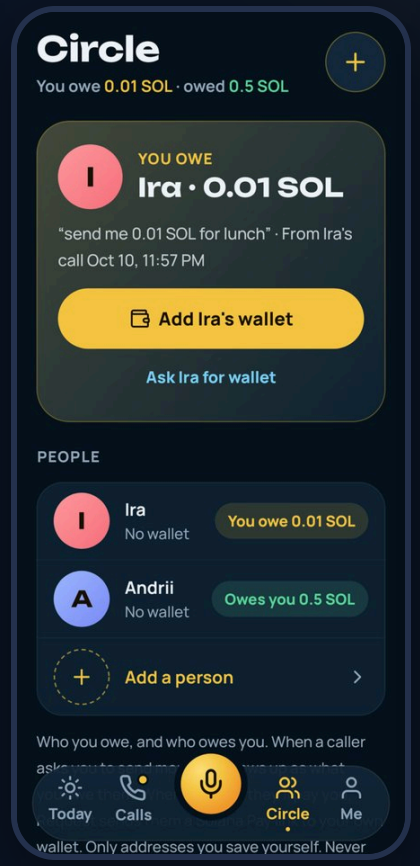

Call → note → card → one tap in your wallet

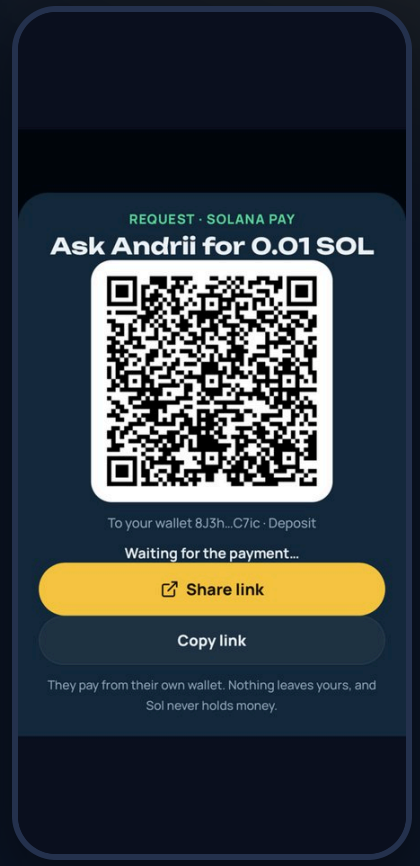

AI secretary's note

Morning stack: swipe to clear

Circle: who owes whom

Solana Pay request + Paid ✓

- Carrier forwards missed calls to a SIP line; a realtime voice agent talks to the caller.
- The note becomes cards: call back, remind, pay.
- Payments in **SOL, USDC and SKR**, simulated on mainnet before the wallet opens.
- Hold-to-talk voice assistant: "who do I owe?"
- Daily Seeker Season tasks from official sources.

SOLANA MOBILE STACK

Built on the stack, not wrapped around it

Mobile Wallet Adapter 2.0 shipped

clientlib-ktx 2.0.8 plus a custom LocalAssociation session layer: authorize / reauthorize with cached tokens, sign_and_send_transactions, typed error handling. Works with Phantom, Solflare and the Seed Vault Wallet. The app never holds a key.

Seed Vault code ready · device test in M1

Seed Vault Wallet is detected and shown by name; all signing goes through it over MWA. Not yet verified on a physical Seeker: I test on an Android tablet with Phantom. Milestone 1 fixes that.

Sign In With Solana + Genesis Token shipped

SIWS over MWA, then a server-side Seeker Genesis Token (Token-2022) check unlocks a Verified Seeker badge and bonus secretary minutes.

SKR + Solana Pay + dApp Store store review

SKR balances and SKR payments from call cards and Circle (transferChecked, ATA created if missing). Solana Pay links and QR with reference keys detect Paid ✓ on chain. v1.2.14 was submitted to the Solana dApp Store on 15 Oct 2026 and is in review.

Safety by design: every transaction is simulated first, addresses heard on a call are never used (scam warning), and Digital Asset Links bind the app identity to app.solardepin.net.

TRACTION · HONEST NUMBERS, 23 OCT 2026

Shipped in two weeks, pre-launch on users

WHAT	STATUS
Public Android releases on GitHub (since 9 Oct 2026)	**20 releases**, **191 APK downloads** in total (this includes my own test installs and hackathon judges)
Solana dApp Store	"Sol Assistant" v1.2.14 submitted 15 Oct 2026, **in review**
Real mainnet payments from the app	Two Circle payments of 0.01 SOL through Phantom/MWA on 10 Oct 2026, each settled in ~3–4 s (Solscan links in the README)
AI secretary	Live on a shared demo line, **+380 91 481 0885**: anyone can call it now
Hackathons	Submitted to Solana Mobile CLOCK IN and Colosseum (Oct 2026). In Encode Solana Hackathon now: "pay from any chain" via Aurora Intents, a live quote on Base USDC → Solana
Users, revenue	Pre-launch: family and friends testers only, no revenue yet

WHY SEEKER · WHY SKR

A daily reason to open the Seeker wallet

- **Sticky by default.** Calls arrive every day, so the morning stack gives a habit that comes from real to-dos, not points.
- **Native Android only.** Call forwarding, notifications, background workers, voice, and the hardware wallet. This can't be a web page and it can't be on iOS.
- **Viral loop.** Each Solana Pay request goes to someone outside the app. With any-chain pay, a friend on Base or Tron can still pay you.
- **SKR as the money of the app:** Pro paid in SKR at a discount, SKR payments and requests from call cards, and SKR deposits for no-show protection in the Business plan.
- **Seeker perks:** Genesis Token holders get bonus secretary minutes (live) and a free first month of Pro (planned).
- **Seeker Connect:** the one-tap "Connect with Seeker" path (SDK released 21 Oct 2026) will sit next to the generic MWA picker.

MILESTONES · $15,000 TOTAL · ~20 WEEKS

Three milestones, each with public proof

M1 · Seeker-native launch
$4,500 · week 6

- Real Seeker device: full call → card → Seed Vault payment flow verified, video + Solscan proofs
- Seeker Connect one-tap connect and SIWS sign-in (compileSdk 36)
- Live on the Solana dApp Store with a production key, crash reporting, a hardened MWA session
- Public changelog and release

M2 · SKR Pro + own numbers
$6,000 · week 13

- Personal secretary phone numbers for Pro users
- Pro subscription paid via MWA in USDC or SKR (SKR discount), verified on chain by a Solana Pay reference
- Free first Pro month for Genesis Token holders
- SKR/USDC deposit request from a call card (Business beta for barbers, repair shops, freelancers)

M3 · Open-source kit + growth
$4,500 · week 20

- MIT Kotlin library extracted from Sol: MWA pay sheet with simulate-before-sign, Solana Pay reference "Paid ✓" detection, SPL transferChecked with ATA, scam-address guard. Docs and a sample app
- Independent security review of the transaction code
- Seeker community launch, EN/UA tutorials. Targets: 500 Seeker installs, 100 weekly actives

Weeks count from grant approval. Each milestone is paid after a public release, a demo video and on-chain proofs.

USE OF FUNDS

$15,000, mostly shipping time and real-phone costs

ITEM	M1	M2	M3	TOTAL
Developer time (solo founder, full-time, ~20 weeks)	$3,000	$3,750	$2,500	**$9,250**
Seeker test device (retail price, shipping to Ukraine)	$500	–	–	**$500**
Telephony: secretary numbers and call minutes for beta users (Zadarma, ~$5/number/month)	$450	$750	–	**$1,200**
AI voice and LLM inference for beta users (hard caps per call and per day)	–	$1,500	–	**$1,500**
Infrastructure: dedicated Solana RPC, Cloudflare Workers paid plan, crash reporting	$350	–	–	**$350**
Independent security review of the signing and transaction code	–	–	$1,500	**$1,500**
Launch content: store media, tutorials, community launch	$200	–	$500	**$700**
Total	**$4,500**	**$6,000**	**$4,500**	**$15,000**

TEAM · LINKS

Vadym Bilobrovets, solo founder (Ukraine)

- Builds the whole stack himself: Kotlin Android, Cloudflare Workers, realtime voice AI, Solana transactions.
- Shipped 20 public releases of Sol in its first two weeks; the release history is on GitHub.
- Winner of Web3 Resilience Lab 2026 with Solar DePin (Binance, Mintsyfra, Lviv IT Cluster, W3I).
- Superteam Ukraine member. Solana School (Solana Foundation) Fall 2026 student, Aug 31 – Oct 16, 2026.
- Other funding: none received. A Solana Foundation grant application for a separate open-source project (Sol Solar MCP) was filed on 23 Oct 2026.
